

WATER-REPELLENT SLEEVE

Convenience and uniqueness.

WATER-REPELLENT SLEEVE.

Technology is a great asset, especially when it generates targeted solutions for specific applications or products that are often used in particular conditions.

This is the case, for example, of white wine, sparkling wine or champagne bottles, which are dipped in the ice bucket to maintain the right temperature.

Against a successful result, that is the wine temperature remains fresh, water dripping when the bottle is lifted off the ice is quite unpleasant.

As a solution to this negative feeling, which may end up with the consumers' not appreciating the wine, the Aro Group has designed the water-repellent sleeve, a heat-shrinkable film, which, thanks to a particular treatment, sheds water. So, the wine remains fresh, but the bottle stays dry, remaining elegant and unique.
