SLEEVE FOR CONTAINMENT

Effectiviness and safety

SLEEVE FOR CONTAINMENT.

Sometimes practicality and safety meet. In all those cases, solutions must offer maximum effectiveness in the simplest way. For example, in the medical field, the use of IVs or glass bottles makes it possible to control the quantity of the contents, during the administration of substances, assessing the time left or the end of the treatment.
But it is also necessary to prevent any possible breakage of the glass in case of accidental bumps or falls.

The Aro Group has designed a highly effective and very simple solution: the sleeve for containment.
This is a tough, transparent film that completely envelops the bottle. In this way, the advantage of maximum visibility of the contents remains, but in the event of a broken IV or bottle, the glass and liquid remain inside the sleeve, avoiding risks and dispersion.
