

COLLAR

Resistance and information.

COLLAR.

Some products are subject to weathering or temperature changes, as the result of their use or storage outdoors. Labels that identify them are subject to the same conditions, but the information contained thereon must remain readable. A case in point is that of cylinders, which are often exposed to low or high temperatures, wind, dust, rain.

For these conditions, the Aro Group has developed specific collars: they are wraparound labels, resistant to weathering.

Product identification data can be printed on these labels.
